ODOC is an OSS Fit Check SaaS Service designed to reduce wasted OSS review time by pre-screening OSS candidates into Try First, Caution, or Skip, with customer interviews testing whether this can save at least 10–30 minutes per candidate.

\ O /	Interview Count	MEET	ZOOM	CALL
NEW	15	14	1	0
TOTAL	15	14	1	0

Interview Results: Hypotheses & Experiments

Last Week Interview	structured Interview	screening Interview	Inperson / Zoom
15	6	9	14 / 1

Hypotheses

1. **Problem Context**
   OSS review friction would be stronger when software had to be selected for a real project rather than for casual exploration.
2. **Repeated Verification**
   Participants would repeatedly check multiple sources before deciding whether an OSS candidate was worth trying.
3. **Drop or Replacement Factors**
   Compatibility, maintenance, documentation, dependencies, licenses, and security concerns would affect whether candidates were rejected or replaced.
4. **Desired Improvement**
   Participants would want to reduce repeated checking, uncertainty, and unsuccessful trial-and-error.

Experiments

Interview Participants

- U.S.-based developers, researchers, and student builders
- Interviews and short conversations conducted in Berkeley and San Francisco
- Participants with different levels of recent OSS project experience

Questions Asked

- A recent project in which they considered or used OSS
- How they searched for and formed candidate options
- How many candidates they compared, tried, dropped, or replaced
- What they rejected or abandoned candidates
- Which sources outside GitHub they used and trusted
- How much time the review process took
- Which repeated parts they most wanted to reduce or simplify

Interview Results: Hypotheses & Experiments

Last Week Interview	structured Interview	screening Interview	Inperson / Zoom
15	6	9	14 / 1

Results

1. **Recent Project Experience Mattered**
   The strongest responses came from participants who had recently selected, rejected or replaced OSS for a real project.
2. **Review Required Multiple Sources**
   Participants described checking README files, documentation, issues, releases, dependencies, licenses, and compatibility information before trying a candidate.
3. **GitHub Was Not the only Source**
   Participants also mentioned search engines, AI tools, community discussions, technical posts, and colleagues as additional sources of information.
4. **Repeated Checking Created Friction**
   Repeated verification, uncertainty about compatibility or maintenance, and testing unsuitable candidates were recurring concerns.

Discussions

A. New Questions

- **Who experiences this problem most frequently?**
  Which roles review OSS often enough for the problem to become significant?
- **What creates the highest cost?**
  Is the greatest burden review time, failed installation, compatibility debugging, replacement work, or team coordination?
- Which evidence is essential?
  What information must be verified before someone feels confident enough to try an OSS candidate?
- How large is the problem?
  How many candidates are reviewed, how long does each review tak, and how often does this process occur?

B. Process Changes

- Screen for OSS decision made within the last six months
- Prioritize one concrete recent project
- Distinguish high-fit, medium-fit, and low-fit participants

Get Funnel

A. Get Funnel Hypothesiss

Get Funnel: From Awareness to Paid Pilot

Working assumptions to test - CAC, conversion rates, and pricing are not yet validated.

Primary Customer Segment (1)

Tech leads, engineering managers, and PIs in small development or research teams that recently evaluated multiple OSS candidates for a real project.

Stage	Customer State & Key Actions	Get Activities (Examples)	Target Numbers
1. Awareness They feel OSS review friction but don't know us yet.	Not aware of our team Experiencing repetitive checks, uncertainty, failed attempts Potentially interested if the problem resonates	OSS, Python, AI, DevSecOps communities Developer meetups, OSPO networks Warm introductions Educational content about OSS review pain	**50** target accounts reached
2. Interest They recognize the problem and engage with us.	Replies to outreach Describes a recent OSS adoption or replacement case Agrees to follow-up	Reply & initial conversation Understand recent OSS decision Share relevant materials Invite to deeper discussion	**15** responses **8** qualified leads
3. Consideration They evaluate if it can work for their team.	Reviews a real case with us Agrees to test with an actual repository Includes a technical decision-maker or buyer	Deep-dive on one real project Pilot proposal & success criteria Walkthrough / sample output Address team requirements and concerns	**3** pilot discussions **2** active pilots
4. Purchase They pay for a pilot or subscription.	Confirms value in pilot Gets budget approval or decides to subscribe Becomes a paying customer	Paid pilot Team / Lab subscription Ongoing support & onboarding	**1** paying customer

Estimated Acquisition Time

4-8 weeks

(Awareness → Purchase)

Estimated CAC

≈ $1,000

per paying customer
(30 team hours + $100 tools / travel)

Expected Annual Revenue

$1,200 - $3,600

per team
(Initial pricing hypothesis)

B. Top 3 Customer Segments: Get Strategy & Economics

Compare Segments: Get Strategy, CAC, and Revenue

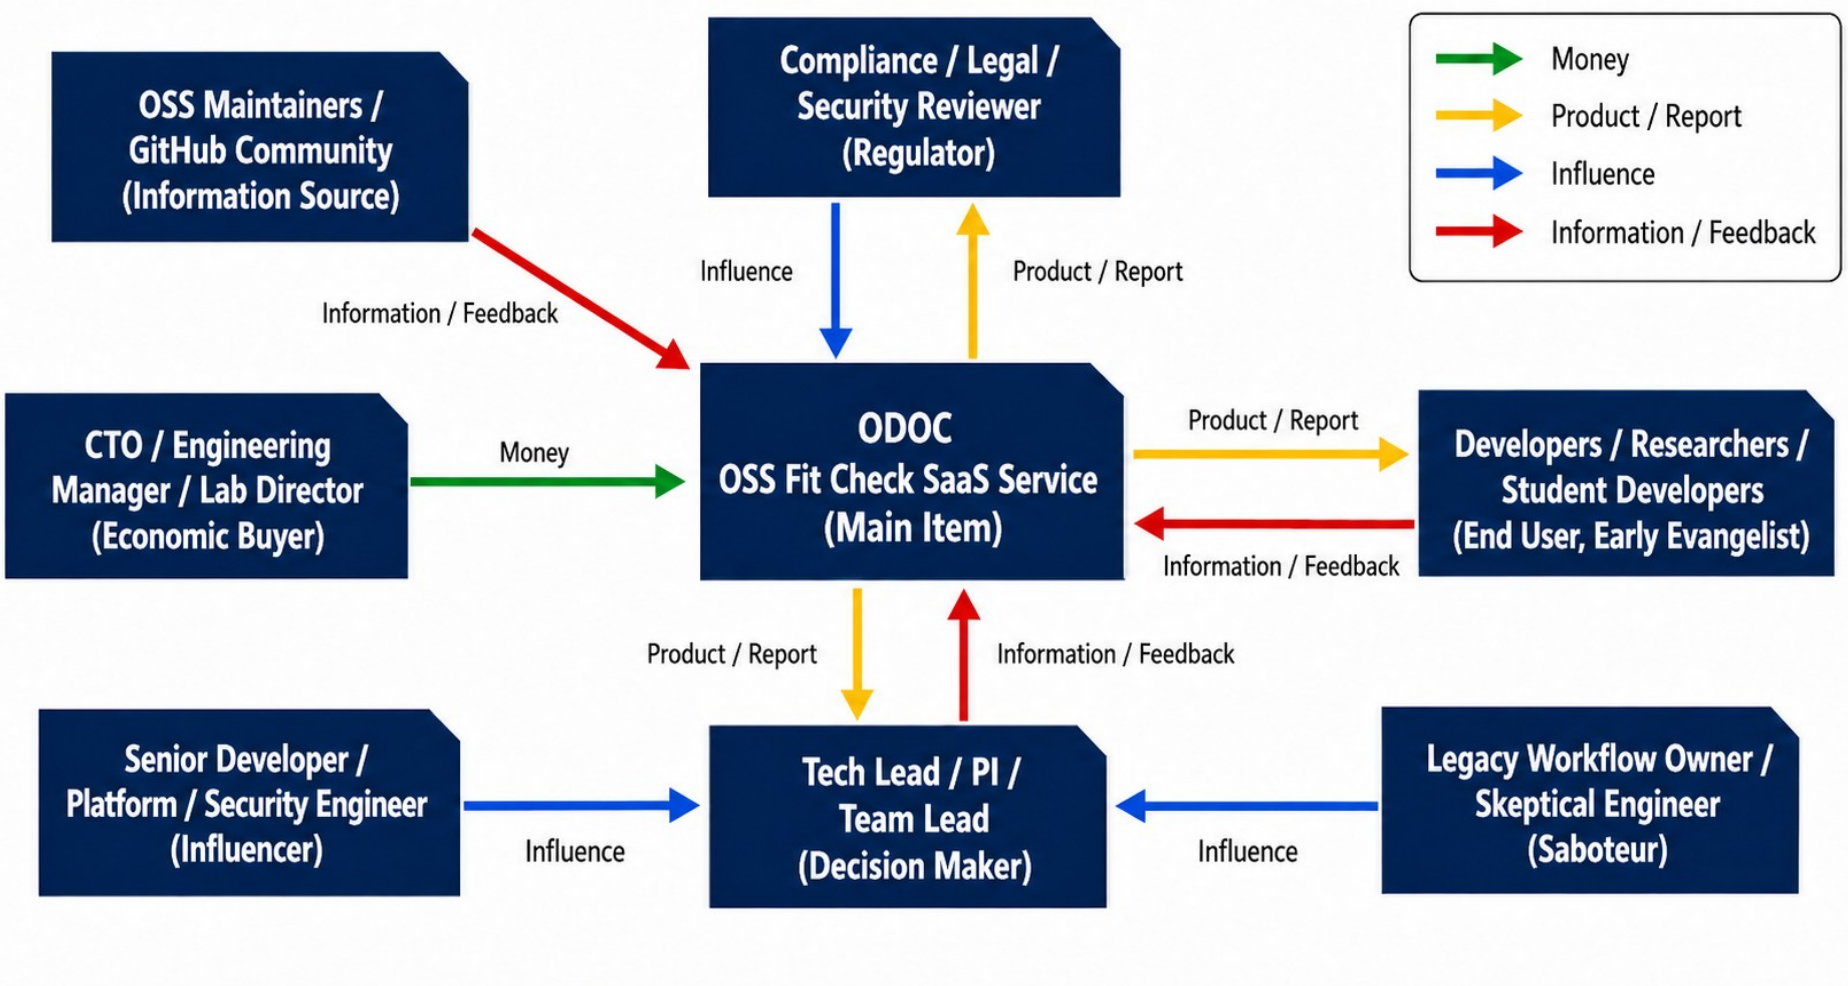

Preliminary assumptions to compare customer accessibility, acquisition cost, and revenue potential.

Customer Segment (Priority)	Buyer / User	Main Get Strategy (Examples)	Sales Cycle (Time)	Estimated CAC	Expected Revenue (Annual)
1. Small dev / research teams (Primary)	Tech Lead, Engineering Manager, PI	Targeted outreach Warm introductions (mentors, networks) OSS communities, meetups Pilot with real project	**4-8 weeks**	**$600 - $1,200**	**$1,200 - $3,600 per year**
2. Individual developers / researchers	Developer, Research Engineer	Community content Meetups, GitHub, LinkedIn Early adopter program Self-serve / Freemium entry	**1-4 weeks**	**$50 - $200**	**$180 - $360 per year**
3. Security / Platform / DevSecOps teams	Security Lead, Platform Lead, DevSecOps Engineer	Expert outreach Security communities, OSPO networks Partner / Advisor referrals Paid pilot	**8-12 weeks**	**$1,500 - $3,000**	**$3,000 - $10,000 per year**

Channel Hypotheses to Test

- Where do these customers discover new developer tools?
- Do they prefer community recommendations, direct outreach, or warm introductions?
- Who must be involved before agreeing to a pilot?
- How long does the pilot and purchasing decision take?

Customer Ecosystem Map

Primary customer segment:

Developers, researchers, and student developers who review OSS candidates before installation.

Skinny Business Model Canvas

Key Partnerships

Key Activities

Value Propositions

- Reduce wasted OSS review time before installation.
- Convert scattered repository information into a clear **Try First / Caution / Skip** judgment.
- Help users decide which OSS candidates are worth testing before setup.
- Provide evidence-based reasoning from README, issues, releases, dependencies, and license signals.
- Test whether ODOC can save **10–30 minutes per OSS candidate**.

Customer Relationships

Customer Segments

- **Developers, researchers, and student developers**
  who review OSS candidates for real projects.
- **Small dev/research teams**
  where OSS adoption affects time, compatibility, or risk.
- **Tech leads, PIs, or engineering managers**
  who care about reducing failed OSS adoption attempts.

Who we plan to talk to this week
